How we produce and consume food has a bigger impact on Americans' well-being than any other human activity. The food industry is the largest sector of our economy; food

touches everything from our health to the environment, climate change, economic inequality, and the federal budget. From the earliest developments of agriculture, a major goal has been to attain sufficient foods that provide the energy and the nutrients needed for a healthy, active life. Over time, food production, processing, marketing, and consumption have evolved and become highly complex. The challenges of improving the food system in the 21st century will require systemic approaches that take full account of social, economic, ecological, and evolutionary factors. Policy or business interventions involving a segment of the food system often have consequences beyond the original issue the intervention was meant to address. A

Framework for Assessing Effects of the Food System develops an analytical framework for assessing effects associated with the ways in which food is grown, processed, distributed, marketed, retailed, and consumed in the United States. The framework will allow users to recognize effects across the full food system, consider all domains and dimensions of effects, account for systems dynamics and complexities, and choose appropriate methods for analysis. This report provides example applications of the framework based on complex questions that are currently under debate: consumption of a healthy and safe diet, food security, animal welfare, and preserving the environment and its resources. A Framework for Assessing Effects of the Food System describes

the U.S. food system and provides a brief history of its evolution into the current system. This report identifies some of the real and potential implications of the current system in terms of its health, environmental, and socioeconomic effects along with a sense for the complexities of the system, potential metrics, and some of the data needs that are required to assess the effects. The overview of the food system and the framework described in this report will be an essential resource for decision makers, researchers, and others to examine the possible impacts of alternative policies or agricultural or food processing practices.

"There is a puzzling disconnect

between rising income inequality and public opinion in the United States. One might think—and many politicians argue—that as inequality increases the public on the losing side of the inequality divide would demand more redistributive action from government. But many Americans have not demanded these policies. Indeed, Americans have trouble identifying their own positions in the changing economic hierarchy; the public's appetite for economic redistribution has remained relatively unchanged; and the American social safety net has not become more generous. The authors argue that this cannot be explained solely by voter ignorance or ideological commitments. Instead they contend that Americans are increasingly insulated from the reality of inequality

by increasing geographical segregation from the rich. And, as their economic anxiety increases, in an effort to feel better about themselves, they tend to compare themselves not to the rich but to those who are lower down on the socio-economic scale"--
