Compared to 2-phase motors, 3 phase stepper motor can provide more torque and it has a better performance in over-loading. That is to say, when the load gains, no like other steppers, 3 phase stepper motor will not stall easily. And it has a good dynamic property at the same time. As 3-phase motor has a smaller step angle than 2-phase motors, it moves more smoothly.

The 3-phase stepper motors are accurate, powerful and sturdy and excel with a high power density. Due to the high holding torque, a gearbox is not required in most cases. Sine commutation allows for almost fully resonance-free operation of the motor. A drive system consists of the 3-phase stepper motor and the appropriate drive.

A stepper motor rotates with a fixed step angle, just like the second hand of a clock. This angle is called "basic step angle." MOONS' offers several types of "basic step angle" as standard motors: 2-phase stepping motors with a basic step angle of  $0.9^\circ$  and  $1.8^\circ$  and 3-phase stepping motors with a basic step angle of  $1.2^\circ$ .

Three-phase stepper motors are useful in applications that require very-high resolution (micro-stepping) as well as minimal noise and vibration. This TIDA-01362 design achieves all of these requirements by driving a three-phase stepper motor using Texas Instruments DRV8313 brushless DC (BLDC) motor driver. The

## Driving Three-Phase Stepper Motor With BLDC Motor Driver ...

Three phase stepper motors are superior in several ways: see this advertising literature. Unfortunately for using this with simple stepper drivers, they have an extra coil of wire that simple drivers have no way to control. Two phase motors have two isolated coils, while three phase motors have three coils connected in a star configuration.

Stepper motors are ideally suited to low speed high torque applications where using a gearbox is not a viable option. They can be used with a relatively simple drive as indexing positional motors- you give it a pulse, it moves a set number of degrees and stops. ... Whereas PM motors are basically 2-phase machines, VR motors require at least 3 phases. Most VR stepper motors have 3 or 4 phases although 5-phase VR motors are available. In a VR stepper motor, the field moves at a different rate than the rotor. Note that Phase A coil has two south poles and no north poles for a flux return path.

A stepper motor, also known as step motor or stepping motor, is a brushless DC electric motor that divides a full rotation into a number of equal steps. The motor's position can then be commanded to move and hold at one of these steps without any position sensor for feedback (an open-loop controller), as long as the motor is carefully sized to the application in respect to torque and speed.
