In vivo animal models are frequently used in orthopedic and trauma research. Due to ethical issues, researchers are focused to replace animal models by establishing novel in vitro systems. However, small tissue fragments are often used in in vitro systems thereby losing tissue 's architecture at some times.

A large number of animal species are used for our orthopaedic models, including rats, rabbits, dogs, sheep, mini-pigs, and goats. The choice of animal model used by an investigator is usually based on considerations related to cost; animal feeding, housing, and care; prior use of that specific model by other investigators; and feasibility for the proposed procedure.

Orthopaedic researchers should begin again to articulate appropriate selection criteria for animal models, clearly focusing on how to most effectively translate basic research elements, e.g., in vitro experiments, cadaveric materials, computer models etc., into appropriate animal models that most reliably translate to both human and animal benefit. This should lead to development of universal hypotheses and compelling requirements to test approaches experimentally only in animal models ...

Over the last two decades, the mouse became the most frequently used animal model in biomedical research due to easy handling, low husbandry costs, a short reproductive cycle, availability of transgenic mice and of specific analytic tools, including monoclonal antibodies against a broad variety of antigens to target individual molecules in vivo. In addition, the mouse genome contents a very high number of orthologs and homologs to human genes, making the mouse a valuable model organism for ...
