We now know, however, that what he was seeing was the periodicity in the atomic structure of the elements. For example, all elements in the first column of the periodic table have one electron in their s-orbital. This electron configuration gives the atom certain chemical traits that are clearly distinguishable from chemicals in other columns of the periodic table.

Atomic and ionic radius don't mean the same thing, but they do follow the same general trend on the periodic table. Ionic radius increases as you move down a period and decreases as you move across a group. So, for the smallest radius, you're looking for an ion near the top of the table and to the right.
