Bipolar or multipolar coordinates offer useful insights and advantages over Cartesian coordinates in certain geometrical problems. In bipolar coordinates (r 1, r 2) the "simplest" curves are the conics, ovals of Cassini, Cartesian ovals, and their special cases, which are characterized by linear or hyperbolic relations in the (r 1, r 2) plane

Bipolar And Multipolar Coordinates

Bipolar coordinates are a two-dimensional orthogonal coordinate system based on the Apollonian circles. Confusingly, the same term is also sometimes used for two-center bipolar coordinates. There is also a third system, based on two poles. The term "bipolar" is further used on occasion to describe other curves having two singular points, such as ellipses, hyperbolas, and Cassini ovals. However, the term bipolar coordinates is reserved for the coordinates described here, and never used for system

Polarity in international relations is any of the various ways in which power is distributed within the international system. It describes the nature of the international system at any given period of time. One generally distinguishes three types of systems: unipolarity, bipolarity, and multipolarity for three or more centers of power. The type of system is completely dependent on the ...

Bipolar neurons are also the functional units of the vestibular system, which plays an important role in maintaining our balance. This vestibular system that is made of vestibular receptors, nerves, and ganglion, are also present in the inner ear and convey sensory data to the brain, which contributes in maintaining upright posture and coordinating head and eye movement.

External balancing emanates from entrance into alliances with other states to test the strength of stronger states or alliances (Lane & Maeland, 2008). There are basically three likely types of systems international system on the basis of the changes in distribution of abilities: Unipolar, Bipolar, and Multipolar (Mearsheimer, 2001).

The most common definition of bipolar coordinates (σ , τ) is. where the σ -coordinate of a point P equals the angle F1 P F2 and the τ -coordinate equals the natural logarithm of the ratio of the distances d1 and d2 to the foci. (Recall that F1 and F2 are located at (- a, 0) and (a, 0), respectively.) Equivalently.
