C# 7.0 introduces language support for tuples, which enables semantic names for the fields of a tuple using new, more efficient tuple types. You can create a tuple by

assigning a value to each member, and optionally providing semantic names to each of the members of the tuple: C#.

C# 7.0 allows other
types to be defined in
such a way that they can
be returned from an
async method. For
instance we plan to have
a ValueTask<T> struct
type. It is built to
prevent the allocation of
a Task<T> object in
cases where the result of

the async operation is already available at the time of awaiting. For many async scenarios where buffering is involved for example, this can drastically reduce the number of allocations and lead to significant performance gains.

A Quick Overview of C# 7.0 Web Application Templates Most developers starting a project today will want to provide web application support, even if the initial application is a desktop application. Users no longer want to be tied to the desktop; they want to spread their wings and use devices of every

sort anywhere they want to access their data.

@unwind: note also that
0 is an octal integer
constant, and is a special
case of the fact that in
general one can write
0[0-7]* for an octal
integer constant. Not
that it makes any
difference whether 0 is
formally defined to be

an octal vs decimal
constant, but as it
happens the grammar
classifies it as octal, as it
does the \0 escape :-) –
