Observed 556 184 193 61 Expected 559 186 186 62. The total observed is 994, so I found the expected values as so:  $9/16 = x/994$   $x = 559$   
 $3/16 = x/994$   $x = 186$   $1/16 = x/994$   $x = 62$ . Chi square =  $[(556-559)^2/559] + [(184-186)^2/186] + [(193-186)^2/186] + [(61-62)^2/62]$

Chi Square Practice Problems - Video & Lesson Transcript ...

Now calculate Chi Square using the following formula:  $\chi^2 = \sum (O - E)^2 / E$ . Calculate this formula for each cell, one at a time.

For example, cell #1 (Male/Full Stop):

Observed number is: 6 Expected number is:

6.24. Therefore,  $(6 - 6.24)^2 / 6.24 = 0.0092$

Chi-Square Practice – Dr. Matt C. Howard  
answer choices A chi-squared distribution with  $k$  degrees of freedom is more right-skewed than a chi-square distribution with  $k+1$  degrees of freedom. A chi-square distribution never takes negative values. The degrees of freedom for chi-square test is determined by sample size.

Chi-Square =  $3.146 + 2.602 + 1.998 + 1.652 + 0.720 + 0.595 = 10.712$ , with 2 d.f. 10.712 is bigger than the tabulated value of Chi-Square at the 0.01 significance level. We would conclude that there seems to be a relationship between height and leadership qualities.

$(56-50)\text{sqr}/50 = (6)\text{sqr}/50 = 36/50 = .72.$   
For cell (2) it equals  $(44-50)\text{sqr}/50 =$   
 $(-6)\text{sqr}/50 = 36/50 = .72.$  Add cell one and  
cell two and we get  $.72 + .72 = 1.44.$  This is  
Chi-square calculated.

### CHI-SQUARE Exercises

The chi-square test helps us answer the above question by comparing the observed frequencies to the frequencies that we might expect to obtain purely by chance. Chi-square test in hypothesis testing is used to test the hypothesis about the distribution of observations/frequencies in different
