Coral reefs provide protection and shelter to nearly one-quarter of all known marine species and have evolved into one of the largest and most complex ecosystems known to humans. Coral reefs are home to over 4,000 species of fish, 700 species of coral and thousands of other plants and animals. This diversity of species provides a large gene pool giving communities more resilience during extreme environmental conditions and climate change.

One of the most exciting parts of setting up a marine aquarium for the first time is the introduction of corals, but the process can be nerve wracking, especially to the newcomer to the hobby. This is entirely understandable, just about all of what we might consider corals are sessile. They may be able to move over a very long time period, but in the main any coral is entirely dependent upon the aquarist to give it the conditions it needs to thrive, it can't swim away and sulk like a fish ...

Inspired by the Caribbean section from *The World Atlas of Coral Reefs*, and augmented with detailed maps and colorful illustrations, this guidebook informs divers and travelers about the natural history of coral reefs and major diving sites throughout the Caribbean region. It's both a natural history guide and a travel guide.

Remote sensing stands as the defining technology in our ability to monitor coral reefs, as well as their biophysical properties and associated processes, at regional to global scales. With overwhelming evidence that much of Earth's reefs are in decline, our need for large-scale, repeatable assessments of reefs has never been so great. Fortunately, the last two decades have seen a rapid expansion in the ability for remote sensing to map and monitor the coral reef ecosystem, its overlying water column, and surrounding environment. Remote sensing is now a fundamental tool for the mapping, monitoring and management of coral reef ecosystems. Remote sensing offers repeatable, quantitative assessments of habitat and environmental characteristics over spatially extensive areas. As the multi-disciplinary field of coral reef remote sensing continues to mature, results demonstrate that the techniques and capabilities continue to improve. New developments allow reef assessments and mapping to be performed with higher accuracy, across greater spatial areas, and with greater temporal frequency. The increased level of information that remote sensing now makes available also allows more complex scientific questions to be addressed. As defined for this book, remote sensing includes the vast array of geospatial data collected from land, water, ship, airborne and satellite platforms. The book is organized by technology, including: visible and infrared sensing using photographic, multispectral and hyperspectral instruments; active sensing using light detection and ranging (LiDAR); acoustic sensing using ship, autonomous underwater vehicle (AUV) and in-water platforms; and thermal and radar instruments.

Emphasis and Audience This book serves multiple roles. It offers an overview of the current state-of-the-art technologies for reef mapping, provides detailed technical information for coral reef remote sensing specialists, imparts insight on the scientific questions that can be tackled using this technology, and also includes a foundation for those new to reef remote sensing. The individual sections of the book include introductory overviews of four main types of remotely sensed data used to study coral reefs, followed by specific examples demonstrating practical applications of the different technologies being discussed. Guidelines for selecting the most appropriate sensor for particular applications are provided, including an overview of how to utilize remote sensing data as an effective tool in science and management. The text is richly illustrated with examples of each sensing technology applied to a range of scientific, monitoring and management questions in reefs around the world. As such, the book is broadly accessible to a general audience, as well as students, managers, remote sensing specialists and anyone else working with coral reef ecosystems.
