Prestressed concrete is a structural material that allows for predetermined, engineering stresses to be placed in members to counteract the stresses that occur when they are subject to loading. It combines the high strength compressive properties of concrete with the high tensile strength of steel.

The purpose of this book is to explain the fundamental principles of design for prestressed concrete structures, and it is intended for both students and practising engineers. Although the emphasis is on design—the problem of providing a structure to fulfil a particular purpose—this can only be achieved if the designer has a sound understanding of the behaviour of prestressed concrete structures.

Flexural Analysis of Prestressed Concrete Structures

Precast concrete systems combine structural and architectural components to create long-lasting buildings and structures. From high-rise office buildings to landmark bridges, parking structures to correctional facilities, stadiums to schools—even in high seismic zones—precast concrete can achieve safe, beautiful, and durable results.

The text is divided into two parts: the first addresses the analysis and design of reinforced concrete structures and the second covers topics in prestressed concrete. This edition has been fully updated to reflect recent amendments and addenda to the Australian Standard for Concrete Structures AS 3600–2009 and allied standards.

Prestressed concrete is a form of concrete used in construction. It is substantially "prestressed" during production, in a manner that strengthens it against tensile forces which will exist when in service.—5 This compression is produced by the tensioning of high-strength "tendons" located within or adjacent to the concrete and is done to improve the performance of the concrete in service. Tendons may consist of single wires, multi-wire strands or threaded bars that are most commonly made ...

EN 1992: Design of concrete structures EN 1992 Eurocode 2 applies to the design of buildings and other civil engineering works in plain, reinforced and prestressed concrete. It complies with the principles and requirements for the safety and serviceability of structures, the basis of their design and verification that are given in EN 1990: Basis of structural design.

In the design of prestressed concrete member, the estimated loss of prestress due to shrinkage of concrete and creep of concrete and steel is at the order of nearly 200 N/mm². But high tension steel has an ultimate strength of 2100 N/mm² and if initially, to say 1000 N/mm² there will still be large stress in the reinforcement after making a deduction for the loss of prestress.

A design procedure incorporating the GRG method is used for nonlinear optimization of prestressed concrete simple beams (Abadie and Carpentier 1969) and (Lasdon and Warren 1978). The objective function considered is the total materials cost of the beam. This function is minimized subject to strength and serviceability requirements.
