Digital Signal Processing N G

Digital signal processing is the use of digital processing, such as by computers or more specialized digital signal processors, to perform a wide variety of signal processing operations. The digital signals processed in this manner are a sequence of numbers that represent samples of a continuous variable in a domain such as time, space, or frequency. In digital electronics, a digital signal is represented as a pulse train, which is typically generated by the switching of a transistor. Digital si

Therefore in Digital Signal Processing (DSP), the type of signals we shall be concerned with shall be functions of n which could be positive or negative values e.g -14, 0, +15, etc. The plot of the signal versus the variable n can be shown on a 2D plot on paper.

A discrete sequence $x[n]$ is a sequence of numbers $x[n]$; where $x[n]$ denotes the n -th number in the sequence ($n \in \mathbb{Z}$). A discrete sequence maps integer numbers onto real (or complex) numbers. We normally abbreviate $x[n]$ to $x[n]$, or to $x[n]$ if the running index is not obvious. The notation is not well standardized.
