How endpoint protection works. Endpoint security is the practice of safeguarding the data and workflows associated with the individual devices that connect to your network. Endpoint protection platforms (EPP) work by examining files as they enter the network. Modern EPPs harness the power of the cloud to hold an ever-growing database of threat information, freeing endpoints of the bloat associated with storing all this information locally and the maintenance required to keep these databases ...

AES encryption has three different block ciphers: AES-128 (128 bit), AES-192 (192 bit) and AES-256 (256 bit). These block ciphers are named after the key length they use for encryption and decryption. All these ciphers encrypt and decrypt the data in 128-bit blocks but they use different sizes of cryptographic keys.
