A STUDY OF CUBIC SPLINE INTERPOLATION

In addition, compared with high-order interpolation, cubic spline interpolation has the advantages of simple calculation and good stability. Cubic spline interpolation has been widely applied. For example, cubic spline interpolation was used to control the quality of air temperature . By interpolating the temperature observations for each altitude segment, suspicious values in the temperature observation data can be more effectively marked.

Cubic-spline interpolation. 1 Abstract: The need to interpolate is widespread, and the approaches to interpolation are just as widely varied. For example, sampling a signal via a sample and-hold circuit at uniform, T-second intervals produces an output signal that is a piecewise-constant (or zero-order) interpolation of the signal samples.

Cubic splines for image interpolation and digital filtering Abstract: This paper presents the use of B-splines as a tool in various digital signal processing applications. The theory of B-splines is briefly reviewed, followed by discussions on B-spline interpolation and B-spline filtering.

Interpolating With Cubic Splines Journalsg

Interpolating With Cubic Splines Journalsg The goal of cubic spline interpolation is to get an interpolation formula that is continuous in both the first and second derivatives, both within the intervals and at the interpolating nodes. This will give us a smoother interpolating function.

a study on interpolation which is cubic spline interpolation [8]. Besides studying the cubic spline interpolation and its applications in numerical analysis such as representing functions by approximating polynomial and data correlation, he also did cubic splines interpolation with simulations in MATLAB.

Cubic Spline Interpolation A spline is a piecewise polynomial of degree k that has $k-1$ continuous derivatives. The most commonly used spline is a cubic spline, which we now define. Definition (Cubic Spline) Let $f(x)$ be function defined on an interval $[a; b]$, and let $x_0; x_1; \dots; x_n$ be $n+1$ distinct points in $[a; b]$, where $a = x_0 < x_1 < \dots < x_n = b$. A cubic spline, or cubic

Cubic B-spline quasi-interpolation Given an interval $I = [a, b]$, let $S_d(x)$ denote the space of splines of degree d and C^{d-1} on the uniform partition $x_n = x_{i-1} = a + ih, 0 \leq i \leq n$, where $h = (b-a)/n$, where $b = x_n$. With the following de-Boor-Cox formula, $B_{i,0}(x) = 1$, $u_{2i} = x_i, x_{i+1} = 0$, otherwise 0 for $d=0$ and $B_{i,d}(x) = x_i x_{i+d} x_{i+1} B_{i,d-1}(x) + x_{i+d} x_{i+1} x_{i+d+1} B_{i,d-1}(x)$

Two interpolation methods are presented, both of which use multiple Piecewise Cubic Hermite Interpolating Polynomials (PCHIPs). The first method is based on performing 16 PCHIPs on 8 rotated versions of the plot of the data versus an independent variable (such as pressure or time). These 16 PCHIPs are then used to form 8 interpolations of the original data, and finally, these 8 are averaged.
