The Medical Device industry is one of the fastest growing industries in the world. Device manufacturers are producing increasingly sophisticated and complex medical device software to differentiate themselves in the battle for dominance in this sector. The increase in the complexity of medical device software has introduced new challenges with respect to making medical devices and their associated software safe. Risk management has emerged as key in addressing these challenges. Existing literature on risk management for medical devices has been slow to adequately account for the complex nature of software in modern medical devices. Conversely, excellent progress has been made in the broader Software Engineering community with the production of holistic software risk based models such as the Capability Maturity Model Integration (CMMI®) and SPICE. However, these models do not account for

medical device specific requirements. This book examines the possibility of a unified approach whilst investigating the relevance of the CMMI® SPI model to the medical device regulatory requirements.

The revised standard for Service Management, ISO/IEC 20000-1: 2018 is the third version of the international standard for service management, replacing the 2011 edition. It provides requirements for the planning, design, transition, delivery and improvement of a Service Management System, which is the coordinated set of policies, processes, organisational structure and people to manage services. This book introduces the ISO/IEC 20000-1 standard as well as providing extensive practical advice on implementing an SMS that conforms to the requirements. It does so by referring to the ISO/IEC 20000-1:2018 documentation toolkit, which is separately available and contains dozens of templates that allow you to provide the documented evidence necessary.
