Normally used in isometric testing this is the time from the end of peak torque production to the end of the motion. Demonstrates the decay of a tetanic contraction as such it shows the actual endurance potential of the muscle fibres. Average Torque: Used in isometric testing and normally replaces work.

A high figure is expected in endurance testing. In isometric and isokinetic tests the deviation is worked out from torque whilst in isotonic tests the deviation is from position. Agonist antagonist ratio: The peak torque of the weaker muscle group divided by the peak torque of the stronger muscle group then multiplied by 100 to give a percentage.
