Programming tasks are problems that may be solved through programming. When such a task is defined, Rosetta Code users are encouraged to solve them using as many different languages as they know. The end goal is to demonstrate how the same task is accomplished in different languages. These are the Programming Tasks that have been defined and ...

The Fisher–Yates shuffle is an algorithm for generating a random permutation of a finite sequence—in plain terms, the algorithm shuffles the sequence. The algorithm effectively puts all the elements into a hat; it continually determines the next element by randomly drawing an element from the hat until no elements remain. The algorithm produces an unbiased permutation: every permutation is equally likely. The modern version of the algorithm is efficient: it takes time proportional to the ...

Code. Thanks to the Rosetta code, here is the modern Fisher-Yates algorithm in some of the common languages. (Note that if the language has an internal shuffle, this is typically mentioned first. Even though it is obviously preferable to use internal shuffling if its available, it is still very illuminating to see how the modern Fisher-Yates ...
