Lattice Boltzmann methods (LBM), originated from the lattice gas automata (LGA) method (Hardy-Pomeau-Pazzis and Frisch-Hasslacher-Pomeau models), is a class of computational fluid dynamics (CFD) methods for fluid simulation. Instead of solving the Navier – Stokes equations directly, a fluid density on a lattice is simulated with streaming and collision (relaxation) processes.

The lattice-Boltzmann method has been applied to many complex flow problems in the past[1-5]. However, its application to aeropropulsion applications has not been reported. To apply the lattice-Boltzmann method to aeropropulsion related flow problems, more specifically, to turbomachinery flow simulations, there are two major hurdles to be overcome.

The lattice Boltzmann methods (LBMs) for moving boundary flows are presented. The LBM for two-phase fluid flows with the same density and the LBM combined with the immersed boundary method are described. In addition, the LBM on moving multi-

Historically, the LB method , , , , , originated from the lattice gas automata (LGA) method , which is a simplified, fictitious version of the molecular dynamics (MD) method with the time, space, and particle velocities being all discrete. In 1997, He and Luo , demonstrated that the LB equation can be rigorously derived from the linearized continuous Boltzmann equation of the single-particle ...

The OpenLB project provides a C++ package for the implementation of lattice Boltzmann methods that is general enough to address a vast range of transport problems, e.g. in computational fluid dynamics. The source code is publicly available and constructed in a well readable, modular way. This enables for a fast implementation of both simple academic test problems and advanced engineering applications.

The lattice Boltzmann method is a powerful technique for the computational modeling of a wide variety of complex fluid flow problems including single and multiphase flow in complex geometries. It is a discrete computational method based upon the Boltzmann equation. It considers a typical volume element of fluid to be composed of a collection of particles that are represented by a particle velocity distribution function for each fluid component at each grid point.

The lattice Boltzmann method (LBM) is an algorithm for simulating the flows of fluids. Conventional numerical schemes, such as finite difference, finite elements and finite volumes, rely on discretising macroscopic continuum equations.
