ARCHIMEDE'S PRINCIPLE Fluid exerts pressure on the surfaces of a body which is either partially or completely submerged into it. We consider a potato shaped irregular body ABCD (fig.) completely submerged in a fluid at rest. The body may be of any size, shape and weight distribution. The body consider is acted upon by two system of forces: I.

Fluid mechanics is basically ?F = d(mv/dt) (Newton's 2nd Law, the sum of the forces is equal to the rate of change of momentum) applied to a fluid. What distinguishes a fluid from a solid is that a solid deforms only a finite amount due to an applied shear stress (unless it breaks), whereas the fluid continues to deform as long as the shear stress is applied.

Fume hoods are used to take in fumes from chemical lab stations and ventilate them into the atmosphere. The simplest type is where the fume hood releases the same amount of air at a constant rate all the time, no matter what. These CAV Fume hoods (Constant Air Volume) are the simplest type of fume hoods available.
