Monarch butterflies and milkweed, enjoy a complicated relationship. You know the type. It's a scenario in which the two mutual parties are co-dependent upon one another. Of course, that level of dependency is fraught with pitfalls. The majestic monarch butterfly (*Danaus plexippus*), is strikingly royal in appearance, and yet these delicate creatures migrate 6,000 miles roundtrip, from Mexico to Canada and back, every

September to October. Eastern and northeastern populations, up to 500,000 monarch butterflies, migrate at this time. Originating in southern Canada and the United States, they travel to overwintering sites in central Mexico. The butterflies arrive at their roosting sites in November.

~~Monarch butterfly migration - Wikipedia~~

One of nature's epic events is underway: Monarch butterflies' fall migration. Departing from all across the United States and Canada, the butterflies travel up to 2,500 miles to cluster at the same...

~~Monarch butterflies' spectacular migration is at risk, and ...~~

His team ' s research concluded that the loss of milkweed, not migration, is primarily responsible for the monarch ' s decline. Milkweed disappeared rapidly in the late 1990s after farmers started planting herbicide-tolerant crops in the Upper Midwest, where studies have shown that more monarchs were produced per acre than in other habitats.

~~Milkweed, not migration, is behind monarch loss, study ...~~

Monarch caterpillars feed exclusively on the leaves of milkweed, the only host plant for this iconic butterfly species. As such, milkweed is critical for the survival of monarchs. Without it, they cannot complete their life cycle and their populations decline.

~~Milkweed for Monarchs - National Wildlife Federation~~

The Monarch butterflies' arduous annual migration, which will end months later in Mexico, begins at the geographical latitude of the Great Lakes. It is late August. To the west of Chicago, in the prairies of Iowa, Monarch butterfly caterpillars are eating their fill of the leaves of the milkweed.

~~Monarch butterfly and their annual migration to Mexico ...~~

The monarch butterfly or simply monarch (*Danaus plexippus*) is a milkweed butterfly (subfamily Danainae) in the family Nymphalidae. Other common names, depending on region, include milkweed, common tiger, wanderer, and black veined brown. It may be the most familiar North American butterfly, and is considered an iconic pollinator species.

~~Monarch butterfly — Wikipedia~~

Fall – southerly migration Temperatures begin to drop, day length shortens, milkweed and nectar sources become sparse and the monarch realizes that it is time to head to Mexico. Most monarchs live four to six weeks, but those born at this time will have a different biological makeup that allows them to make such a strenuous migration.

“ We plant milkweed specifically to attract monarch butterflies and it benefits other species, too. It ’ s the only thing that provides habitat for monarchs to lay eggs, develop into caterpillars to chrysalids and then emerge as a butterfly. Plus, having native plants supports birds and other species.
