Solutions Section 13 Problem 13.1.

Let X be a topological space; let A be a subset of X . Suppose that for each $x \in A$ there is an open set U containing x such that $U \cap A$ is open in X . Show that A is open in X . Solution: Let \mathcal{C} be the collection of

topology on $X = \tilde{X}$ so that π is continuous, viz, $U \cap X = \tilde{X}$ is open $\iff \pi^{-1}(U)$ is open. The resulting topological space is called the quotient space. E.g. Let $I = [0;1] \subset \mathbb{R}$ and $X = I/I$. We put the weakest equivalence relation on X s.t. $(0;x) \sim (1;x); (x;0) \sim (x;1)$ for $x \in I$. We sometimes sum up this info in the following picture: $\begin{matrix} & & \sim & & \\ & & \wedge & & \\ & & \wedge & & \\ & & \sim & & \end{matrix}$

Working problems is a crucial part of learning mathematics. No one can learn topology merely by poring over the definitions, theorems, and examples that are worked out in the text.

In fact, it is also necessary to get a handle on some fair amount of algebraic topology first, for a full-fledged coverage of the differential treatment. Regardless, one great reference for a rigorous and worthwhile excursion into the area (covering brief introductions to the Morse and cobordism theories as well), is the excellent title by Morris W. Hirsch, which is available on the Springer ...
