Admittance, just like impedance, is a complex number, made up of a real part (the conductance, G), and an imaginary part (the susceptance, B), thus: $Y = G + jB$. $\{displaystyle Y=G+jB,\!\}$ where G (conductance) and B (susceptance) are given by: $G = \frac{1}{R^2 + X^2}$ $B = \frac{-X}{R^2 + X^2}$

In the power systems analysis field of electrical engineering, a per-unit system is the expression of system quantities as fractions of a defined base unit quantity. Calculations are simplified because quantities expressed as per-unit do not change when they are referred from one side of a transformer to the other. This can be a pronounced advantage in power system analysis where large numbers of transformers may be encountered. Moreover, similar types of apparatus will have the impedances lying
