Like Scheme, Python can be run in one of two modes. It can either be used interactively, via an interpreter, or it can be called from the command line to execute a script. We will first use the Python interpreter interactively. You invoke the interpreter by entering python at the Unix command prompt.

Flicking through the table of contents, there seems to be a lot of promise in Python for Unix and Linux System Administration. The book seems targeted specifically for Unix admins, touching on actual problems and providing actual solutions. On the face of it, it looks to be Programming Python with an OS-specific slant.

Note. On Mac OS X,
getgroups() behavior differs
somewhat from other Unix
platforms. If the Python
interpreter was built with a
deployment target of 10.5 or
earlier, getgroups() returns
the list of effective group
ids associated with the
current user process; this
list is limited to a system-
defined number of entries,
typically 16, and may be
modified by calls to
setgroups() if suitably
privileged.
