Radiographic testing uses x-rays or gamma rays to examine the internal structure of manufactured components identifying any flaws or defects. Radiographic testing is a nondestructive testing (NDT) method. RT is divided into two levels, RT level I and RT level II. Level I and II are 40 hours long each, and each course is available for 120-days.

RADIOGRAPHIC TESTING TECHNIQUE A single-wall exposure technique shall be used for radiography whenever practical. When it is not practical to use a single-wall radiographic testing technique, a double-wall technique shall be used. An adequate number of exposures shall be made to demonstrate that the required coverage has been obtained.

Radiographic Testing Procedure - Inspection for Industry

Radiographic Testing (RT) is a non-destructive testing (NDT) method which uses either x-rays or gamma rays to examine the internal structure of manufactured components identifying any flaws or defects. In Radiography Testing the test-part is placed between the radiation source and film (or detector).

Radiography Testing - NDT Inspection - TWI

Industrial radiography is a method of Non Destructive Testing (NDT) where many types of simple or complex geometry manufactured components can be examined to verify the internal structure and integrity. Industrial radiography can be carried utilizing either X-rays (using an X ray tube and generator) or Gamma Rays (using a radiography source such as Ir 192, Se 75, Yb 169 or Co 60 held in or ...

Radiography Course contains the Basic Radiation Safety (BRS), the Radiographic Interpretation (RI) and Radiographic Testing (RT). Radiography can be used for inspection of welds, castings and wrought materials, in metallic and non metallic materials. When the film is processed a negative is produced.

Radiographic Testing (RT) - Welding & NDT Institute

The training is divided into thirteen (13) chapters. They include: 1. Review of Level I data; applications of radiography; types of radiation; the atom; isotope production; decay process; measurement of radioactivity; specific activity; half-life; electron volt; energies of gamma sources and x-rays; ions and ionization; scatter radiation. 2.

Radiographic Testing - Level II - NDT Training

Radiographic testing can provide a permanent film record of weld quality that is relatively easy to interpret by trained personnel. This testing method is usually suited to having access to both sides of the welded joint (with the exception of double wall signal image techniques used on some pipe work).

Radiographic and Ultrasonic Testing of Welds

Radiographic Testing (RT) has long been the go-to method for determining the acceptability of welds in pipelines, pressure vessels, tanks and castings. RT is typically performed using either X-Ray or Gamma ray as the source of penetrating radiation. Both sources produce electromagnetic radiation, with energy and intensity being a variable.
