Solve the quadratic equation: $3t^2 - 8t + 5 = 0$, $\Delta = (-8)^2 - 4 \cdot 3 \cdot 5 = 4$, $t_{1,2} = \frac{-(-8) \pm \sqrt{4}}{2 \cdot 3} = \frac{8 \pm 2}{6} = 1, 5/3$. Rewrite the velocity function in factored form: $3t^2 - 8t + 5 = 3(t - 1)(t - 5/3)$. We see that the velocity is negative when $1 < t < 5/3$. In that time interval, the particle is moving to the left.

Rectilinear Motion - Math24

These are important quantities to consider when evaluating the kinematics of a problem. A common assumption, which applies to numerous problems involving rectilinear motion, is that acceleration is constant. With acceleration as constant we can derive equations for the position, displacement, and velocity of a particle, or body experiencing rectilinear motion. The easiest way to derive these equations is by using Calculus. The acceleration is given by

Rectilinear Motion Problems And Solutions

Rectilinear Motion of Particles Motion is one of the most common phenomena we come across in our daily lives. For example, a moving car, a kid running on the road or a fly moving in the air are all said to be in motion. So, in general terms, a body is said to be in motion if it changes its position with respect to a reference point and time.

Solving Rectilinear Problems - Example Problem 2.3-2. A car is driving down a straight flat road. The acceleration of the car follows the a-t graph shown. The car starts from rest at $t_0 = 0$ seconds, reaches its maximum velocity of 45 m/s, and drives at that velocity for 5 seconds. The driver then applies the brakes slowing the car to an eventual stop.
