The primary function of Safety Relief Valves is the protection of life, property and environment. A Safety Relief Valve is a (safety) device designed to protect a pressurised vessel or system against over-pressure should all other safety systems fail. By Nick Smith – Marketing – Seetru Limited. An overpressure incident is defined by any situation/condition which would cause the pressure in a vessel or system to increase beyond its specified design pressure or maximum allowable working ...

~~Safety Relief Valves: Purpose & Function Guide~~

Relief valves are normally used for liquid service, although safety valves may be so used. Ordinarily, relief valves do not have an accentuated huddling chamber nor a regulator ring for varying or adjusting blowdown. They therefore operate with a semi-modulating action in proportion to the system pressure.

746 Safety Relief Valve. The 746 Safety Relief Valve incorporates a freely pivoting disc, which ensures correct alignment with the nozzle. The combination of top guiding, unobstructed seat bore and full lift capability ensures the highest possible discharge rate thus maximum plant protection. Due to the large flows available the inlet pipework must be sized to give a maximum inlet pressure drop of 3% The 746 safety relief valve is available in both conventional and balanced bellows types ...

Description. Inta ' s WRAS* approved and CPR compliant safety relief valves have been designed to protect closed circuit water heating systems from over pressure which can build up as a consequence of heating the water or any other fault conditions resulting in excessive pressure. Available with 1/2 or 3/4 connections and a range of pre-set discharge.

The terms TSV and PSV, as they relate to thermal and pressure safety valves respectively, are often called by a few other names. They might be called relief valves, pressure relief valves, or simply safety valves. Regardless of the name, they do perform the task of relieving pressure when a dangerous level has been reached.

Safety Valve A pressure relief valve characterized by rapid opening or closing and normally used to relieve compressible fluids. Relief Valve A pressure relief valve characterized by gradual opening or closing generally proportional to the increase or decrease in pressure. It is normally used for incompressible fluids. ~~PRESSURE RELIEF VALVE ENGINEERING HANDBOOK~~

A relief valve or pressure relief valve (PRV) is a type of safety valve used to control or limit the pressure in a system; pressure might otherwise build up and create a process upset, instrument or equipment failure, or fire. The pressure is relieved by allowing the pressurized fluid to flow from an auxiliary passage out of the system.

~~Relief valve - Wikipedia~~

There are two types of safety valves: spring-loaded safety valves and pilot operated safety valves. In a spring-loaded safety valve, the closing force is generated by a helical spring. The set pressure is adjusted by pretensioning this spring with the adjusting screw. In the event of impermissible overpressures, the safety valve opens accordingly. Pilot operated safety valves (POSV) use the system pressure to generate the closing force.
