Spatial And Temporal Uses Of

Spatiotemporal, or spatial temporal, is used in data analysis when data is collected across both space and time. It describes a phenomenon in a certain location and time — for example, shipping movements across a geographic area over time (see above example image). A

Spatial mining is the extraction of knowledge/spatial relationship and interesting measures that are not explicitly stored in spatial database. Temporal mining is the extraction of knowledge about occurrence of an event whether they follow Cyclic , Random ,Seasonal variations etc. 3. It deals with spatial (location , Geo-referenced) data.

The spatial and temporal linkages between turnover of soil microbial communities and their associated functions remain largely unexplored in terrestrial ecosystems. Yet defining these relationships and how they vary across ecosystems and microbial lineages is key to incorporating microbial communities into ecological forecasts and ecosystem models.

Gait analysis is used for clinical identification of deviations from normal gait. Kinematic gait analysis is concerned with the description of gait components. It deals with movement as opposed to kinetic which deals with the forces acting on or exerted by the body. For this we can use distance (spatial) and time (temporal) parameters.

Spatio-Temporal Parameters – What Do They Mean ...

Spatial and temporal resolutions are also different from the same or different satellites. High temporal resolution can be useful when tracking seasonal changes in vegetation on continental and global scales, but when downscaling to small regions, a higher spatial resolution is needed, and frequently with lower temporal resolution.

In normal usage, spatial relates to space and temporal relates to time. We may speak of spatial awareness, for example. Temporal things are those of this world, those of the time in which we find ourselves, the word often being used in contrast to spiritual, divine or heavenly, which relate to a different dimension.

Assessing both the temporal and spatial dimensions of data adds significant complexity to the data analysis process for two major reasons: 1) Continuous and discrete changes of spatial and non-spatial properties of spatiotemporal objects and 2) the influence of collocated neighboring spatiotemporal objects on one another.

Spatial Resolution. Spatial resolution is a measure of the smallest object that can be resolved by the sensor, or the ground area imaged for the instantaneous field of view (IFOV) of the sensor, or the linear dimension on the ground represented by each pixel. From: Advanced Remote Sensing, 2012. Related terms: MODIS; Wavelength; Temporal Resolution
