The diagrid (diagonal grid) is a framework composed of beams that intersect in a diagonal pattern. These beams may be metal, wooden, or concrete, and they are used in the design of high-rise buildings as well as roofs. The diagrid has an economical advantage as it does not require as much steel as the ordinary steel frame.

A building is said to be a high-rise when its appearance and proportion is slender to give a tall building or it's reasonably higher than the surrounding buildings. In Figure 2.1, the evolution and construction of high-rise buildings commenced towards the end of 19th century in Chicago. The transportation of building materials and the capability of communication to higher levels made possible by the inventions of the safe elevator in 1853 (Otis,2015) and the telephone in 1876, (Biography ...
