Individual chapters thoroughly investigate each energy approach as the book covers both current energy production and future strategies. The author assumes reader familiarity with the basic concepts of freshman-level physics and chemistry. The text emphasizes the complexity of energy issues and the need for a multidisciplinary approach to solving energy problems. Quantitative end-of-chapter problems emphasize analyzing information, correlating data from various sources, and interpreting graphical data and interpolate values. Readers see real problems in producing and

strategies and follows the guidelines of ABET, the major engineering accreditation body. The book approaches these topics on a rigorous level -- familiarity with the basic concepts of freshman Physics and Chemistry is needed. The book contains enough material for a typical one semester course. The end-of-chapter problems are predominantly quantitative in nature. However, most are not straight forward calculations based on substituting values from the chapter in to the appropriate formula. The problems are designed to require the students to analyze information, to make use of material from previous chapters, to correlate data from various sources (not only from the textbook itself but from library, internet or other

sources) and in many cases to estimate quantities based on interpretation of graphical data, interpolation of values and sometime just plain common sense. While maintaining a quantitative approach to the study of energy in our society, the text and accompanying problems show that this is a complex and very interdisciplinary topic. This approach is intended to provide students with an appreciation for the real problems that are encountered in the understanding of how we produce and use energy, and the realization that, while exact calculations are important and necessary, a broadly based analysis is often most appropriate. This three volume compendium begins with a review of our past dependence on fossil fuels as our primary energy source and our future needs to change how our energy is produced and utilized due to diminishing resources and environmental impact. The first volume presents the major options for carbon-free energy including hydroelectric and solar energy for both thermal applications and the production of electricity, wind energy, and biofuels as a replacement in the

transportation industry. Yet, all of these options will not work on a large scale without proper energy storage, which is the topic of the second and third volumes. The second volume reviews the possible methods of storing energy in the form of mechanical or thermal energy. Mechanical methods include those that make use of gravitational potential energy and the storage of energy by compressing air or by storing as rotational energy in a flywheel. Sensible heat storage is discussed in terms of its applications to residential heating, community-based storage, solar ponds, and thermal storage for grid-integrated energy systems. The third volume considers various methods of energy storage that make use of electrochemical reactions, electric and magnetic
