fiber structure and established TA methods, to advanced TA techniques and their application to high-performance fibers and textiles. Thermal analysis is a convenient method for assessing fiber and fabric performance as monitored under end-use relevant conditions. Expertise in this field requires knowledge of both TA methods and of fiber behavior, information that is brought together in this new volume. In recent years, thermal analysis has been applied to a variety of novel and high-performance fibers, such as Kevlar, Vectran, PBI, polyolefins, polypropylene, PAN and PVA, amongst others. TA techniques are also used in fiber identification, characterization and stability testing and may be combined with spectroscopic techniques to yield still more information about fiber properties. Includes chapters on novel

The extraordinary growth in the production and use of man-made fibers over the past few decades has focused attention on the surface properties of fibers and textiles. This volume combines surface science and technology in its presentation of the substantial progress that has been made in the technology related to the surface characteristics of natural, synthetic, and glass fibers and textiles. Adopting an interdisciplinary approach, the coverage places emphasis

upon the wetting, soiling, staining, frictional, and adhesive properties of fibers and fabrics, as well as phenomena related to these properties. The book offers critical reviews which describe experimental facts, theories, and processes. Symbols are clearly defined in each chapter. Among the subjects covered are the surface properties of glass fibers, soil release, stain and water repellance, friction of fabrics, bonding of nonwovens, and the wetting of fibers. *Surface Characteristics of Fibers and Textiles, Part II* is an outstanding textbook for courses dealing with surface chemistry, the mechanical properties of textiles, textile technology, and polymer chemistry. It is also a valuable reference book designed to make current knowledge on these subjects accessible to industrial and academic researchers.

Due to their complexity and diversity, understanding the structure of textile fibres is of key importance. This authoritative two-volume collection provides a comprehensive review of the structure of an extensive range of textile fibres. Volume 2 begins by reviewing natural fibres such as cellulosic, cotton, protein, wool and silk fibres. Part two considers regenerated cellulosic, protein, alginate, chitin and chitosan fibres. The final part of the book discusses inorganic fibres such as glass, carbon and ceramic fibres as well as specialist fibres such as thermally and chemically-resistant fibres, optical and hollow fibres. Chapters review how fibre structure contributes to key mechanical properties. A companion volume reviews the structure of manufactured

polymer fibres. Edited by leading authorities on the subject and with a team of international authors, the two volumes of the Handbook of textile fibre structure is an essential reference for textile technologists, fibre scientists, textile engineers and those in academia. Discusses how fibre structure contributes to key mechanical properties Reviews natural fibres such as cellulosic, cotton and silk fibres and considers various regenerated fibres Examines inorganic fibres including glass and carbon as well as specialist fibres such as chemically-resistant and optical fibres

sustainable materials, along with the rising cost of petroleum - the basic ingredient of synthetic fibers - have once again brought natural fibers and their composites to the fore. The renewed interest in natural fibers is only a few decades old. Thus, the pioneering work of current researchers in this new era of natural fiber composites will help to illuminate the path for future researchers as they explore new potentialities for natural fibers. Sabu Thomas and Laly Pothan, themselves leaders in the field, bring together cutting edge research by eminent scientists in Natural Fiber Reinforced Composites. Covering the latest research trends such as nano technology, the book will be a valuable resource for the natural fiber composite researcher.

Testing methods for the measurement of fabric mechanical properties and structure parameters are also explored. With its renowned editor and contributions from some of the world's leading authorities, Structure and mechanics of textile fibre assemblies is an important reference for textile scientists, technologists, engineers and those designing and manufacturing textiles. It will also be suitable for those within the academic sector. Examines aspects of fabric structure and mechanical properties for a range of fabrics Discusses structure and mechanics of yarn and woven, nonwoven and knitted fabrics Explores testing

Cotton is the most important natural fiber crop of our planet, which provides humanity with cloth and vegetable oil, medicinal compounds, meal and hull for livestock feed, energy sources, organic matter to enrich soil, and industrial lubricants. Therefore, cotton research to improve sustainable cotton production worldwide is the vital task of scientific community to address the increasing demands and needs for cotton products. This Cotton Research book presents readers updated information and advances in current cotton science investigations. Chapters of this book provide the latest developments on cotton research and cover topics on cotton
