sbp2 devices) utilize the SCSI command set. By using Linux pseudo SCSI device drivers which bridge between the native protocol stack and the SCSI subsystem, the upper level SCSI device drivers, including sg, can be used to control "non?SCSI" devices. This is the third major version of the sg driver. A summary of the sg driver history is as follows:

This buffer is set after a command is completed (after a read () call) and contains the SCSI sense code. Some command results have to be read from here (e.g. for TESTUNITREADY). Usually it contains just zero bytes. The value in this field is set by the generic driver (kernel) side.

The device type is of special importance, since it determines the mandatory and optional command sets for this device. If you don't want to program it yourself, you may want to use the scsiinfo program from Eric Youngdale, which requests nearly all information about an SCSI device.
